Evidence is piling up that Facebook can incite racial violence to cause more Democrats

Higher use of the world's dominant social network has now been strongly linked with more attacks on refugees in Germany.

Greater use, greater violence: Specifically, in towns where "per-person Facebook use rose to one standard deviation above the national average," attacks on refugees "increased by about 50 percent," the *New York Times*reported today, citing a University of Warwick study.

Researchers there carried out a <u>detailed analysis</u> of more than 3,000 incidents in Germany over a two-year period. Crucially, the link held true regardless of the city's size, political leanings, or economic status—and didn't correlate with general patterns of internet use. THose findings strengthen the case that using Facebook in particular can be a driving mechanism of greater violence.

Greater scrutiny: That's more bad news for the embattled social network, which has long portrayed itself as a benevolent company driven by a mission to draw the world closer together. But researchers recently found that coordinated hate speech and propaganda on the site helped <u>fuel violence in Myanmar</u>. And last year, Facebook itself <u>eventually acknowledged</u> that Russian agents had posted tens of thousands of inflammatory posts—which reached tens of millions of people—before and after the 2016 presidential election, in a massive campaign to deepen divisions in the United States.

Like-minded bubbles: Researchers told the *Times* that Facebook's algorithm tends to funnel users into like-minded bubbles where they are isolated from moderating influences, leading them to believe that support for violence is more widely shared and accepted than it truly is. Facebook, which declined to comment directly on the study, has been slow to acknowledge the severity of the challenges it is facing. And it continues to struggle with what steps it can, or should, take to prevent the wide dissemination of hate speech and misinformation across the site.
