## It is no longer possible to work in the Technology industry and also be a Patriot (whatever)

by behindtheline

It is no longer possible to work in the Technology industry and also be a Patriot. I say this as someone who has been working in Hi Tech for many decades. I started in the hardware industry and in the 90s got into the development of web technologies and software. I rode the "dot com bubble" all the way to it's peak and suffered though the bubble bursting. I worked for small start ups trying to make it big and I worked for big tech giants that were trying to change with the times. I worked for a consulting firm for a while and even briefly ran my own start up before I cashed out. About 10 years ago everyone decided they needed a mobile app and did that too. Eventually I moved into developing SaaS or "software as a service" and got into Machine Leaning, AI and Big Data applications... In short i have been there and done that. I've been involved since before we had the internet as we know it today and I have seen first hand how we got here today. My conclusions:

- Every single "big" tech company either started out evil or has become evil over time.
- In the long run everyone in tech works for a "big" tech company.
- We all know the above truths at least subconsciously (or you have not been around long enough) but we get paid good money to keep quite.

Small companies do not survive in the long run. They either grow into big companies, get bought by big companies, or they die. Some small companies are very profitable and when they are privately owned, sometimes they choose to stay small. The owners get rich and grow old. In a maximum of about 15-20 years, even very profitable small tech companies go away once the founders retire. Consolidation in Tech is very real.

The bigger the tech company the more it is driven by profits, AKA Greed. The bigger the company the more it will abandon it's morals and will do whatever is profitable. It goes something like this: You sell adds... and then you realize you can sell

demographic data... and then you realize you can sell personal info for even more... and then the Gov asks for access to customer data for what seems like really good reasons... and before you know it you have an automatic data dump the exports user activity every night to some three letter Gov agency database.

Somewhere along the line you get uncomfortable with the moral implications of what you are doing. Your only valid recourse is to quit and there is a line of people who will gladly fill your chair. Quitting does not stop the evil... it only clears your conscious. Any options other than taking the money and staying quite or quitting will land you jail, sued into poverty or worse. I have been down the quitting road. I went to a small start up that was building software that really helps people... I enjoyed several years of feeling like my job saved lives. And then the company was acquired by a bigger company... and a year or two latter that company was acquired by a Fortune 500 tech giant... This cycle cannot be escaped in the long run. Career change is the only real escape. I am in the process of moving to a new company for moral reasons but I know it is only a temp fix. I feel trapped. I have a family and children that depend on me and every single job skill I have is in the tech field. I am starting the process of career change but the reality is that getting out of hi-tech will likely come with a very significant pay cut and impact to my quality of life.

Why am I typing this rant? I want people to understand and I want people out side of tech to help.

- Strategic Division of Labor is a big part of the problem. Many people are only involved with a very small piece of the conspiracy. They sleep at night thinking "I'm just building a tool... and tools can be used for good or evil."
- Massive conspiracies by definition require massive numbers of people to be involved. People in tech know what is going on and are often responsible even if only by inaction or complacency.
- Don't let your friends be comfortable in positions of inaction or complacency. Call them out. Challenge them to really consider the moral implications of their work. Make them feel guilty.
- STOP FEEDING THE BEAST. Delete Facebook. Pick up a phone and call your friends and family. Root your

phone and delete the Google apps. Put a piece of tape over the webcam on your laptop. Don't find your TV show by talking into the Comcast remote (in fact put tape over that too). Learn Linux. Delete fucking Windows10.

What you're describing is not unique to tech. The most important thing for you to do is to maintain your unique skills at a very high level, so that you can be of critical importance to the society that comes next. Abandoning an entire industry is not the answer, because it only yields that battleground to the enemy. Stay behind enemy lines and know that you are not alone. Our day will come, and when it does your skills will be much needed.

I was recently at the California "winter home" of a Fortune 50 Csuite Executive in high-tech. In his computer room is an impressive collection of historical books with a heavy emphasis on the confederacy. Smack dab in the middle is a framed picture of him shaking the hand of President Trump in a private setting. Surprised, I asked him about it and his response was "most of us put on a good show because the younger workforce is always Liberal until they grow up".

I'd suggest a lot more people just pretend than you realize. Hightech especially is full of younger talent due simply to the nature of the younger generations growing up with technology and being more acclimated and inclined to take those jobs and be high performers.

If you're not a liberal at twenty you have no heart, if you're not a conservative at forty you have no brain.

```

This this this. I knew a CEO of a huge tech company. You probably use them. He is definitely conservative but a lot of times they have to make liberal decisions to avoid the huge flack they get nowadays by all the flippant idiots.

permalink parent

[-] **jthun2 1** points (**+1**|**-0**) 1.7 hours ago

Yep, a lot of us pretend. That C-suite exec can retire at any time. A lot of us can't.

I feel you OP. dad worked in IT all his life, now he's completely corrupted and sold out. I was working in it as well though much lower level, I was pulling cables and punching in boxes for high rise buildings. There used to be a ton of work in cable networking but that's gone away now that everyone already has fiber or broadband. So now the big cable industry is security cameras. Internet connected security cameras that send back all its information to whoever the fuck knows. I hate the idea of big Orwellian government watching us 24/7 with spy cameras, it's like some shit out of a movie and it's creepy as fuck as are the proponents of such a world.

Now I clean driveways and commercial properties working for myself. It's hard manual labor bit at least I'm fixing the world instead of fucking it all up.

Look into a trade school. You won't get rich (unless you do the aforementioned and sell out your company...) But you can definitely feed a family of 5 on an electricians or plumbers wage.

Those industries will never go away or be corrupted because you can't corrupted building pipes to carry away shit. Good luck OP.

its almost as if Kazsinski was 100% correct on how we need to destroy the technological system... Except thats never going to happen, we have a better chance of killing off the majority of the human population than we do of ridding ourselves of tech..

bring on global climate change and the flood to purge this wretched species

I think if we get to space in a big way (meaning it's available to the laymen) it suddenly becomes impossible for the system or governments to exert extreme control over everyone's lives. There is always an opt out (the huge never ending frontier).
It's the only way I see out of Kaczynski accurately predicted/described dystopia. It's one of the reasons I'm rapidly pro white ethnostate.
This sort of bold future techology is not going to come from sub-Saharan Africans or admixed mongrels (not smart enough); and it's not going to come from Asians (not innovative enough), or Jews (create nothing). It must come from us of European ancestry, and in order for that to happen we must both continue to exist; and throw off the shackles that bind us.
permalink parent
[-] Acerphoon 0 points (+0 -0) 28 minutes ago

I'm rapidly pro white ethnostate.

You have to be. Diversity is having a negative impact on a nation's scientific advancements. And it's only going to get worse at the current rate. Bleeding heart liberals and lefties import millions of non-whites with no end in sight.

Not to mention that niggers just... have low IQs. They just do.

permalink parent

[-] **Islamiscancer 0** points (**+0**|**-0**) 1 hour ago

you wont be able to just branch out.. no way sunshine.

there is no way in hell that the businesses that rule those systems would allow people to just run off like that.. maybe in a few thousand years when we could (lets pretend its all possible ok? no science shutdowns - lets just assume we figure it all out and its the reality we exist in)..

but we will be dead.. we wont be there.. so its pointless to base your beliefs on.. UNLESS of course you have and will have children.. You MUST have a horse in the race that keeps racing AFTER you die.. (if you die without children, and not fighting for children, then you are worthless to us as a people)

we are going to get destroyed if we dont clean up house SOON.. we are soon going to be a mix race with no history. we will simply have the right to all exist as humans not as a group of people. you will be allowed to exist and so will all others. lives will have no value. we wont be individuals as we think, we would become a hive entity.

bees and ants and what not..

Jews dont create? are you retarded? What is Currency? Interest? Iol. Seriously though, Jews created a system of control over humans based on our biological subjektive value system, not a logical system free from emotion that is an Objektiv value system. Meaning it has clearly defined measurments.

Jews need to be exterminated, so do Niggers and Muslims.. Literally everyone but whites and a culled asian population (specifically referring to culling Chinese.)

We need to start a new world free of technology, OR, with a strenuously controlled total population number. no more than 500,000 people. world wide. thats if we stuck with

technology, which as i said before we will and people will always want the right to exist. because we are selfish fucks... anyway, yeah, europeans were the best.. thats why we should fill all ancestrally White nations with Blacks and Arabs and what not... No offense america, but unless you clean up your nigger problem first and become white again, you arent ancestrally white'.. you couldnt avoid the slaves - that being said the "Europeans" were mostly responsible for the slaves, because, you know, Americans are Europeans.. You are all in the same boat as Australians sort of.. Except Australia doesnt have a nigger SLAVE problem. Our native problem was quickly resolved, more effectively than Americas natives were - but thats ok. Europeans greed and use of niggers ultimately ruined america. "its time you european bros clean up america while us european bros clean up our european countries.. " would be the jist i guess? permalink parent

Video games, they are the answer you're seeking.

Gamedevs at the highest level are arguably the most advanced technology developers out there, and the majority of them fall back on the safety net mantra of "I'm just making games."

Sure, there's some evil stuff going on like selling of data, but in the end none of that matters to the industry as a whole or how advancements are made, the only things that matter are cool, fun, and interesting gaming experiences and their technical advancements from graphics to audio to input to VR/AR to mobile devices to new consoles to new PCs and so forth.

If you think you've been part of the "Hi Tech" but haven't been part of video games, you don't realize yet what's up. Games are both what you think they are and not even close to what you're thinking they are at the same time. Arcades, for example, yeah they're not nearly as big as they used to be, but guess what they're still around and you can do anything you want with arcade games... brand new tech, brand new experiences, never been done before, whatever you can imagine. And then with existing platforms, again you're free to do anything you can imagine. Or you can do basic game development and it can still be on the cutting edge of tech.

Anything done in the normal software/hardware/tech fields is also done in video games and lot of times something perceived as a major feature or sticking point in other fields is just some minor side thing in games.

Video game development is what you're looking for.

Ummm, no. You have an overly rosy view of game development. I've done both. 4 years at various game studios, and also 5 years recently at a rather prominent Silicon Valley firm.

Yes, there is some good technology in games. No, the average game developer doesn't have anything to do with that. Using Unity or Unreal is a whole lot different from writing Unity or Unreal. There are obviously some very interesting technical details involved in various aspects of computer graphics and GPU utilization. I do appreciate that stuff, but you can find people at big companies doing that as well.

The AI in games is primitive to say the least. I highly doubt the average game developer is going to work their way through grad level stats texts on statistical inference and the like. Not to mention that real machine learning applications require extensive support in the real of provenance, model drift, etc etc. Game AI is fake AI. It's only requirement is to make the game enjoyable to play. Real world AI (where you have lawsuits and goodwill on the line) is way harder.

So I disagree. Yes there are good programmers in the games industry. However, I had an ACM fellow on my last team. I've never seen that in the typical videogames company. There's also some interesting technology in high frequency trading and a host of other areas that pay better. Gaming is notorious for long hours, poor project management, and low pay. You sound like someone who has worked a bit in games but never in a world class company that has interesting projects.

## Pyramidion

There is no coincidence in symbols and the consolidation you describe. Luciferian, mason, Illuminati are easy targets.

My professional background parallels yours. When I was young, I quit a lucrative NSA/NRO contract because they are unethical and specifically violate international treaties. This was before wikileaks or commonality of internet or I may have gone that way. I've since contributed immensely to small and large, public and private tech companies. 98% good people being manipulated by 2% bad people.

What is the root cause? What drives the system you despise? I don't know the exact answer but one correlation always comes up. Fiat currency financing psychopathic behavior every fucking time.

permalink

[-] individualin1984 1 points (+1|-0) 3.5 hours ago

I know this also, I am currently in a very comfy, politically correct to the core company. The biggest damage I do to them is not to fight them when they want to do stupid shit. I just say yes and agree with their stupidity and do what they ask and collect a paycheck until I no longer have a significant financial risk. They do not have a clue on what they are missing and I no longer lament not forcing them to do the correct thing.

I'd argue that if you're working to facilitate centralization of any kind, you're working against humanity. Everything that can be corrupted, will be corrupted. The least dangerous corruption is that of the individual with no power over any other individual.

All the organizations that are all about IP contribute to your enslavement. They must support a totalitarian, surveillance, society to protect their interests. No matter what scale I consider, decentralization seems superior to centralization, which is dangerous.

Decentralization in all the things!

Edit: Damn.. forgot my point! Working on decentralization is perhaps the most patriotic thing this side of hunting tyrants a patriot can do! Support, create, and share, open source, decentralizing, technology!

Good, individual empowering, technology can nullify shitty, centralizing, enslaving, technology. Just innovate around that shit!

There is a pattern out of this - you start a small company and grow it into a big company - the trick is, you keep the company in private hands the whole way. Never become a public company, and you can always refuse to sell.

In a market place where the guys at the top also run the money printing press, they will always have access to unlimited funds so there is no price they cannot pay - eventually all of the larger public companies fall into their web - that is the modern corporate world you see today. Only by keeping your firm in private hands can you refuse to sell. It is the only way to retain your ownership. One of the big differences today, as vrs the 1930's, back in the 1930's the common man knew this about capital and banking they knew you needed to keep your company private if you wanted to keep your company. They also knew you didn't do business with the banks or you would get in trouble. Today people are not taught about capital, or banks, or money, never mind basic economics. Today's tech upstarts believe the path to success is to get a start up going, and launch an IPO as soon as possible - and that this is the only way.

It's the banks that want you to think that is the only way. The owners of those banks are the same owners of all the other public corps. They have the power to lend themselves however much they need to buy you out. When they do not have enough, they simply print more. This is why they oppose the gold standard. They will oppose any standard that would limit their capacity for unlimited purchase.

Too many jewbags in tech. It is laughable how many of those dumbasses there are, yet they only make up less than 2% of the US populace

permalink

[-] **jthun2** -1 points (+0|-1) 1.7 hours ago

There are a lot. Half the 'whites' are either Jews or some form of middle easterner, it seems.

There were some very good Jewish computer scientists in the 60s, 70s, 80s... but they are tailing off lately. The Chinese are outcompeting them (as well as outcompeting regular whites).

permalink parent

[-] truthwoke33 -1 points (+0|-1) 2.7 hours ago

What's more hilarious is they actually believe they are productive and helpful to society when in reality all they do is fuck shit up and have a white man clean up their garbage code or whatever.

[-] **CheeseboogersGhost** -1 points (+0|-1) 2.6 hours ago (edited 2.6 hours ago)

I cant go too far into it but my brother is a electrical engineer. We come from a family of engineers. We used to travel all over the world doing jobs for mining companies. The educated jews weren't able to fix it so we get sent in. We always made it a point to tell them that it took redneck hillbillies to get the job done and made them feel inferior. Every time. I've never seen so many dumbasses as I have these "educated" jew tech guys. I've also talked to company execs and tell them what their problem is and that they should select intelligent people instead of the NY crowd. They didn't like hearing that shit but I told them anyway.

I looked each jew in the eye and laughed at them after I was done with the job.

permalink parent
