

STUNNING TEST RESULTS Reveal How MULTIPLE Email Providers Helped To Fix Midterm Elections For Democrats

-

While lawmakers grapple with how to deal with the censorship of conservatives by tech giants, Facebook, Twitter and Google, a new report by a group called [imge.](#), reveals that email providers may also be working behind the scenes to tilt the scales in favor of Democrats and against Republicans, ultimately affecting the outcome of critical elections.

[imge.](#), a full-service digital firm founded in 2013 that specializes in designing and executing integrated digital campaigns wondered if email providers were attempting to influence the outcome of elections, so they decided to run a test and find out. The results are nothing short of stunning.

[imge.](#) asked:

Is the world of email biased against conservatives?

Many partisans often mutter such an accusation against Silicon Valley. Yet, few digital professionals take the time to investigate whether such a bold claim is true.

Poor email deliverability doesn't just suppress a candidate's message, it decreases the engagement of campaign supporters. That means fewer donations, fewer volunteers, and fewer advocates. If Republicans underperform in email deliverability, they face a disadvantage on Election Day.

So we decided to test the rumors. Our team created email addresses with different email providers and signed up for the email lists of around fifty different candidates, committees, and political nonprofits. In the month leading up to the election, we tracked how many emails were sent from each entity, and what percentage of those emails made it into our inbox. To keep it consistent, we opened every email, every day – regardless of where it was placed.*

To put these numbers in perspective, let's examine two closely contested Senate races.

In Nevada, Democrat Jacky Rosen averaged over 90% placement in inboxes, compared to Dean Heller's over 90% placement in spam.

In Florida, 100% of Republican Rick Scott's emails went to spam in Yahoo, while 100% of Bill Nelson's emails went to our Yahoo inbox.

While these were the most dramatic examples, this pattern emerged in every toss-up Senate race we tracked

What Factors Might Play into Email Deliverability?

One might ask: well, were these conservatives spamming their supporters? Across the five toss-up Senate races we tracked, **Democrats sent over four times the quantity of emails than their Republican opponents.** Only one Senate candidate used a double opt-in, and it was a Republican: [Kevin Cramer](#), who performed the best among the Republicans.

Making it into inboxes, however, takes more than sending the right amount of email. Email deliverability is a complex animal. List quality, content quality, knowledge of best practices, proper verifications – all of these factors feed into whether an email goes into the spam folder.

To be sure, some accusations of “bias” against conservatives on digital platforms can be attributed to a lack of digital sophistication. But these findings are consistent across multiple entities serviced by multiple professional firms. The answer to this **disparity might be structural bias, bad strategy, or some blend of both.** Regardless of the reason, it is clear that Republicans need to find this answer to remain competitive in email marketing.

According to Imge., email is a significant part of their overall strategy to promote a political candidate. Imagine their shock to find out email providers may be acting as gatekeepers to determine which political candidate’s message can or cannot be viewed in their email box.
